

Stravifloor Prefab

Installation Manual

Installation Tools and Components

- Stanley knife
- Ink marker
- Pocket tape measure
- Chalk
- Staple gun (optional) (to fix PE film to formwork)
- Manual transpallet (optional)
- Adhesive spray and tape (if the perimeter isolation is done with a material different than the self-adhesive CDM Stravitec's Perimeter Strip)
- Personal protective equipment (PPE)

1 / Supporting Floor & System Components

Check the supporting floor has a tolerance of 0.1% or 1 mm/m for gradient and a maximum of 2 mm for smoothness.

Ensure that the installation area is watertight and the supporting floor is dry and clean prior to installation.

Unpack the various components and allow them to acclimate to their environment for 24 hours or more before installation.

2 / Perimeter Isolation

All walls, columns and service penetrations through the floating floor should be isolated using Perimeter Strip or medium density mineral wool strips.

The height of this isolation should be the distance between the supporting floor and the finished level of the floating floor.

3 / Stravifloor Prefab Installation

Using the installation plans supplied, mark out the location of each Stravifloor Prefab across the whole floor, using the reference numbers as a guide.

Follow the installation sequence as indicated on the plan.

4 / Tolerance Zones

In order to cope with the dimensional discrepancies between the plan (according to which the system is produced) and the real situation (on site), it is good practice to integrate so called "tolerance zones" in two perpendicular directions.

Close off the tolerance zones by means of a larger cover plate in the same material as the formwork (usually supplied with the system). The tolerance capacity is dependent on the overlap.

5 / Polyethylene Sheeting Protection Layer

Layers of building grade polythene plastic sheeting should be installed over the entire area and continued up the wall to cover the perimeter isolation strip and then be secured to the wall using a 50 mm wide industrial grade self-adhesive tape.

All overlaps should be a minimum of 100 mm and then sealed using the same tape. Ensure the polythene is fitted neatly into the corner areas of the floor to avoid any pocketing which could result in a reduction of slab thickness in these areas.

6 / Reinforcement Mesh & Concrete Pour

Install the reinforcement mesh - single or double grip (bottom and top) depending on the slab thickness - ensuring that the protection layer does not get punctured – any punctures should be repaired with sections of polythene sheeting and taped securely into place.

Concrete can now be poured to the required thickness.
